

Sky POS — User Manual

This guide explains how to use the Point of Sale (POS) system for daily operations: inventory, sales, offers, and settings. It is written for shop staff and managers.

Table of contents

- 1. [Before you start](#)
 - 2. [Inventory and stock](#)
 - 3. [Understanding negative and oversold stock](#)
 - 4. [Fixing stock problems](#)
 - 5. [POS sales \(quick checkout\)](#)
 - 6. [Offers and discounts](#)
 - 7. [Order settings that affect stock and sales](#)
 - 8. [Purchases \(receiving stock\)](#)
 - 9. [Receipts and printing](#)
 - 10. [Frequently asked questions](#)
-

1. Before you start

1.1 Connect to the server (first-time setup)

On a new device or browser, open the POS and go to **Configure backend** (`/pos/configure`).

- 1. Enter your **API URL** (server address), for example `https://your-server.com/api` or `http://127.0.0.1:8000` .
- 2. Run **Test connection**.
- 3. Save when the test succeeds.
- 4. Log in with your user account.

You only need to do this once per device unless the server address changes.

1.2 Main menu areas

Area	Purpose
Sales / POS	Ring up customers, hold orders, checkout
Inventory	View stock, value, low stock, adjustments
Items	Create and edit products
Purchasing	Receive stock from suppliers
Offers	Product and order discounts
Settings	Company, order, payment, inventory rules

2. Inventory and stock

2.1 Inventory Dashboard

Go to **Inventory** → **Inventory Dashboard**.

The table shows each stock record with:

Column	Meaning
Item No	Product code
Description	Product name
Branch	Location / branch where stock is held
UOM	Unit of measure (pcs, kg, pack, l, etc.)
Qty	Quantity on hand at that branch
Reorder	Level at which low-stock warning appears
Expiry	Nearest expiry date (if tracked)
Purchase (Rs)	Last purchase price per unit
Unit Cost	Cost used for inventory valuation
Value	Stock value = on-hand qty × unit cost

Summary cards at the top show **stock value**, **item count**, **low stock**, and **expiring/expired** items.

2.2 Units of measure (UOM)

Quantities always show with their unit, for example 5 pcs or 2.50 kg .

- To add new unit types: **Items** → **Item Settings** → **Units of measure**
- To assign a unit to a product: **Edit item** → **Stock Details** → **Unit of measure**

2.3 Low stock

A row is highlighted when **Qty ≤ Reorder** (and reorder is greater than zero). Use this to plan purchases.

2.4 Row actions (⋮ menu)

From each inventory row you can:

- **View** — item details
- **History** — sales, purchases, and movements
- **Edit** — open the item form
- **Cost view** — costing breakdown
- **Inventory adjustment** — set or change quantity manually
- **Write-off items** — remove damaged or lost stock

3. Understanding negative and oversold stock

3.1 What you see on screen

The system **does not** show a negative quantity in the main **Qty** column anymore.

Situation	Qty column	Extra line
Normal stock	5 pcs	—
Sold out	0 pcs	—
Oversold (sold below zero)	0 pcs	red Short 1 pcs (or kg, pack, etc.)

Value is never negative: if on-hand qty is zero, value shows **Rs 0.00**.

A yellow **warning banner** appears on the Inventory Dashboard when one or more items are oversold. It tells you how many items need stock received.

3.2 What “oversold” means

Oversold means a sale was completed when there was **not enough stock** on hand. Example:

- Stock before sale: **0 pcs**
- Customer buys: **1 pcs**
- Stock in database: **−1 pcs** (oversold by 1)

This is **not** a display error. It records that you owe the customer one unit that was not in the warehouse.

3.3 Why it happens

Overselling is allowed only when this setting is **ON**:

Settings → Order Settings → Allow sales for items with negative inventory

Setting	When ON	When OFF
Allow sales for items with negative inventory	Sales can finish even at 0 stock; qty can go negative	POS blocks adding more than available stock; backend rejects insufficient stock

Common causes of oversold items:

1. Setting above was **enabled** and staff sold at zero stock.
2. Sale completed from **Hold order** or **classic sale form** after stock was already depleted.
3. Stock was never received (new item sold before first purchase).
4. Wrong branch: stock exists at another branch but sale used a branch with 0 qty.

3.4 What oversold does *not* mean

- It does **not** mean the product is broken in the system.
- It does **not** mean you must delete the item.
- It **does** mean you should **receive stock** or **adjust inventory** to correct quantities.

4. Fixing stock problems

4.1 Recommended steps (oversold items)

1. **Find oversold items** — Inventory Dashboard; look for red **Short ...** under Qty.
2. **Receive stock** — create a **Purchase** for the correct quantity from your supplier.
3. **Or adjust manually** — row menu → **Inventory adjustment** → set the correct **new qty**.

4. **Prevent repeat** — if you do not want overselling, go to **Settings** → **Order Settings** and turn **OFF** *Allow sales for items with negative inventory*.
5. **Check History** — row menu → **History** to see which sales reduced stock.

4.2 Example: item 10184 shows 0 pcs and Short 1 pcs

Step	Action
1	You sold 1 unit when stock was 0
2	Purchase 1 unit (or more) or adjustment to qty 1
3	After correction: Qty shows 1 pcs, Short line disappears
4	Value updates to purchase/cost × on-hand qty

4.3 Inventory adjustment (manual correction)

1. Inventory Dashboard → ... on the row → **Inventory adjustment**
2. Enter **new quantity** or **quantity change**
3. Add a note (reason) if your process requires it
4. Save

Adjustments cannot set quantity below zero through the adjustment screen (minimum is 0). To fix oversold data, enter the **true** on-hand count after you physically receive goods.

4.4 Write-off

Use **Write-off items** only for stock that is lost, damaged, or expired — not for normal sales.

5. POS sales (quick checkout)

5.1 Product screen

1. Open **Sales** → **New sale** (POS layout).
2. Search or browse products; tap to add to cart.
3. Cart footer shows line count, subtotal, offer discount (if any), and total.
4. Switch **Retail / Wholesale** if your company allows it (Order Settings).
5. Tap **Checkout** when ready.

5.2 Stock checks at POS

When **Allow sales for items with negative inventory** is **OFF**:

- Out-of-stock items cannot be added.
- Quantity cannot exceed available stock at the sale branch.
- Messages such as “Only X pcs available” appear.

When the setting is **ON**:

- Sales can continue at zero stock.
- Stock may become oversold (see [Section 3](#)).

5.3 Checkout

On checkout you can set:

- Customer
- Manual discount (if allowed)
- **Delivery / service charge** (if enabled in Order Settings)
- Payment method and amount received
- Offers (applied automatically when rules match — see [Section 6](#))

5.4 Hold orders

- **Hold** saves the cart without completing payment/stock (depending on status).
- Resume from **Hold orders** panel.
- Completing a hold deducts stock like a normal sale.

6. Offers and discounts

6.1 Offer types

Type	Applies to	Example
Product offer	Specific products in the cart	8% off when buying 3+ of item X
Order offer	Whole order total	10% off when order ≥ Rs 5,000
Promo order offer	Whole order when code entered	5% off with code SAVES

6.2 Creating an offer

Go to **Offers** → **Add offer**.

1. **Name** — required.
2. **Discount type** — Product or Order.
3. **Apply offer on** — Retail only, Wholesale only, or Retail & Wholesale.
4. **Product offer** — select products and enable a product rule (e.g. % off selected items).
5. **Order offer** — enable *minimum order total* and/or *promo code* rules.
6. Set active dates / days of week if needed.
7. Save.

6.3 Automatic application at POS

The POS applies offers without a dropdown when possible:

1. **Product offers** — if offer products are in the cart and the rule gives a discount.
2. **Order offers (min total)** — if cart subtotal meets the minimum.
3. **Promo offers** — when the customer enters a valid promo code.

If both product and order offers apply, the system uses whichever saves the customer more.

6.4 Manual discount vs offer

- **Offer discount** — from an active offer rule; shown in offer breakdown.
- **Manual order discount** — entered on the sale form if *Allow order discount* is enabled in settings.

Both reduce the total; offer discount is calculated by the offer engine and sent with `offer_id` on save.

6.5 Troubleshooting offers

Problem	Check
Order offer not applying	Min order amount reached? Offer active today? Pricing mode matches Retail/Wholesale? <i>Allow offer</i> ON in Order Settings?
Product offer not applying	Correct products in cart? Quantity rule met (e.g. buy 3)?
Promo not applying	Code spelling (case-insensitive); promo rule enabled on offer
Offer missing after mode switch	Offer may be Retail-only while sale is Wholesale (or vice versa)

7. Order settings that affect stock and sales

Go to **Settings** → **Order Settings**.

Setting	Effect
Allow sales for items with negative inventory	Allows selling at 0 stock; can create oversold (Short) items
Allow quotation for items with negative inventory	Same idea for quotations
Allow delivery / service charge	Delivery cost field at checkout
Allow offer	Enables offers at POS
Allow switching wholesale / retail prices	Price mode toggle on POS
Allow order discount	Manual discount on sales

After changing settings, save and refresh POS if behaviour does not update immediately.

8. Purchases (receiving stock)

Purchases **increase** stock at the chosen branch.

1. Go to **Purchasing** → **New purchase**
2. Select supplier, branch, and items with quantities
3. Complete the purchase
4. Verify quantities on **Inventory Dashboard**

Receiving purchase stock is the normal way to clear **Short** (oversold) lines.

9. Receipts and printing

- Completed sales can be printed from the sales list or immediately after checkout (depending on your workflow).
- Receipts include company header and a **Sky Smart Technologies** software footer on printed copies.
- Letterhead top margin is reduced on narrow (80 mm) receipts to avoid large blank space.

Configure printer and header under **Settings** → **Company** and hardware/print settings as provided by your administrator.

10. Frequently asked questions

Why does Qty show 0 but say “Short 1 pcs”?

You sold one more unit than you had. Receive or adjust stock — see [Section 4](#).

Why is Value Rs 0.00 when I still have a cost?

Value is based on **on-hand** quantity only. Oversold items show 0 on hand until stock is received.

Can I hide oversold items?

Use filters on Inventory Dashboard (product type, branch). Fix or receive stock to clear the Short status.

How do I stop negative stock completely?

Turn **OFF** *Allow sales for items with negative inventory* in Order Settings. Train staff that POS will block sales when qty is 0.

I sold at zero stock before turning the setting off. What now?

Past sales already reduced stock. Use Purchase or Inventory adjustment to set correct quantities.

Where is the real quantity stored?

The database may still hold a negative `qty` for oversold tracking. The dashboard shows **0 on hand** plus **Short** for clarity. After you receive stock, the number returns to normal.

Who can change purchase price on the dashboard?

Controlled by **Item Settings** → **Allow editing purchase price in inventory dashboard**. If disabled, purchase price is read-only on the grid.

Quick reference card — Oversold stock

SYMPTOM:	Qty = 0 pcs, red "Short 1 pcs", Value = Rs 0.00
CAUSE:	Sale completed with insufficient stock
FIX:	Purchase or Inventory adjustment
PREVENT:	Order Settings → OFF "Allow sales for items with negative inventory"
VERIFY:	History on row → see sale movements

Document information
